## Abstract

Hello! This is Pablo testing the abstract. zzzz

## Introduction

Text in the introduction hehehe.

## Aim

The aim of this paper is to assess the status of the technologies and analysis techniques used in determining the conservation status and restoration needs of mangrove forests; as well as identifying research gaps.

## Objectives

1. The first objective is reviewing and determining the current completeness and robustness of different available datasets. Since there are several factors that can alter the access and analysis of data, such as the presence of clouds and shadows when trying to compare data collected by satellites, since they limit the consistency of available images required for continuous change monitoring. [1]

## Methodology

The aim of this paper

## PRISMA Chart

## Findings

This is the section for findings

## Geological Survey Tools

This is the section for geological survey tools

## Computational Analysis Techniques

This is the section for computational analysis techniques

## Research Gaps

This is the section where we highlight research gaps that we found in our review

## Conclusion
